

Conversion Issues:

1. about 75 files appear not to have a <TEI @xml:id> with the appropriate value.
 - a. Should be fixed now.
2. change <ab type="verticle-line"> to <ab rend="vertical">
 - a. cannot find <ab type="verticle-line"> but 'vertical-line' used once; changing to @rend='vertical'
3. <add @type> should become <add @place>
 - a. Done.
4. remove @cert, @correspond and @resp from <add>
 - a. @cert: removed.
 - b. @corresp does in P4-Transcriptions/04-live/liv_000835.xml and P4-Transcriptions/04-live/liv_000872.xml; In both cases these are additions which point (using @corresp) to a deletion to which this addition should be linked. **Given there are only four uses of it in the entire corpus I can remove it, I merely wish to double-check since this is a removal of information linking these two bits of markup.**
5. correct one instance of "recepient"
 - a. This appears twice in liv_000054.xml and should be corrected manually by JC; [done]
6. what is <bibl @where>?
 - a. You have things like:

```
<bibl id="shelfmark">The National Museum of the Royal Navy, Portsmouth, UK, MSS 120</bibl>
<bibl id="ccnumber">0764</bibl>
<bibl id="recipient">John Washington</bibl>
<bibl id="date">10 March 1858</bibl>
<bibl id="where">"Pearl" 1 1/2 PM</bibl>
```
 - b. inside <sourceDesc> and all these @id are converted to @xml:id with the same values. No change.
7. change <bibl xml:id="candc"> to <bibl xml:id="ccnumber">
 - a. This only seems to appear in liv_002567.xml: I'll fix manually. [Done]
8. what is the <damage>? We don't use this.
 - a. Yes you do. liv_000531, liv_000761, liv_000800, liv_001957. For example in the last one it is used four times in liv_001957.xml in this case it is used to mark:

```
<damage type="manuscript" extent="one word"/>
```

I could change this to a <gap/> if that is preferable. Let me know. Whereas 000531 has ones like:

```
e<damage extent="1" unit="chars" agent="blot">m</damage>ployed
```

which I could change to <unclear> if you prefer. **Let me know.**
9. I'm not sure what the date @when's to 2004 and 2006 are (there are a few of these)
 - a. These all appear on <change> elements inside of <revisionDesc> and are used to show dates of major modifications to the file. Sometimes they don't have @when, but sometimes the @when is inconsistent with the content of the <date> Those would have to be changed manually. No change.
10. we don't put @extent or @unit on . If text isn't legible, use <gap/> and put those attributes on gap
 - a. fixed.
11. for the following <del @type> values do the following:
12. remove:
 - a. Their (1)
 - i. Changed to Their since that makes more sense in context
 - b. deletion (1)
 - i. One in liv_000511; fixed in XSLT.
 - c. canceled (1)

- i. Not removed, changed to 'cancelled' since there are lots of those.
- 13. correct:
 - a. strikethrough (1)
 - i. done
- 14. change to "strikethrough":
 - a. blockStrikethrough (3)
 - b. doubleStrikethrough (7)
 - i. both done
- 15. <foreign xml:id="af (1)"> should become <foreign xml:lang="af (1)">
 - a. done
- 16. remove <forename>
 - a. You mention this below as well. I'm assuming you mean to just remove the markup.
- 17. remove all instances of <forename>; replace all instances of <surname> with <persName>
 - a. There are no instances of surname that are not inside <persName> so to be clear what you are asking me to do is change:

```
<persName>
<forename>David </forename>
<surname> Livingstone</surname>
</persName>
```

 and turn it into:

```
<persName>
David <persName> Livingstone</persName>
</persName>
```

Which seems completely daft to me! My suggestion is either get rid of the markup entirely (then why was it marked originally?) or leave forename/surname. You can always leave it even if you don't use it in modern LEAP.
- 18. change <gap agent="blot"> to <gap agent="blotting">
 - a. I have changed this in the ODD, as there were examples and text using 'blot' and I've updated the XSLT conversion
- 19. the following values for <gap @extent> should be examined and corrected: "characters (1) | line (1) | one (5) | word (8) | word? (1)" and the <gap @extent> values overall need to be reviewed as there are some odd ones here.
 - a. I have modified the XSLT conversion to normalise these.
- 20. remove @hand and @resp from <gap>
 - a. done
- 21. <gap @reason> should <become gap @agent>
 - a. I'm assuming you mean where there is both @reason and @agent, remove @reason in favour of @agent; where there is only @reason make it @agent instead. **If so, I've now done that.**
- 22. change <gap extent="0.5"> to <gap extent="1">
 - a. **I've done this but be aware that this means where there were values of 'half a page' you now have @extent='1' and unit='pages'.**
- 23. also change any <gap @extent> where the value includes a ? to remove that ? so "1?" would become "1"
 - a. Done
- 24. remove all instances of <geogFeat>
 - a. Done
- 25. remove @n from <handNote>
 - a. Done
- 26. there are both <handNote> and <handNotes> elements. I think we only need one of these.
 - a. I believe you are mistaken, for handNotes is a container for handNote elements. You shouldn't have a handNote that isn't inside a handNotes element. **Let me know.**
- 27. correct <hi="sup;ul"> to <hi="sup underline">

- a. These only persist in the un-renamed P5 Spectral Files which I've not converted. **Let me know again what you want me to do with these files, but this would already be handled in the conversion if I applied it to them.**
28. take all @n off <lb/>
 - a. Done
 29. change <milestone unit="collumn"> to <milestone unit="column">
 - a. normalised to page/folio/section/column
 30. change <name xml:id="sm"> to <name xml:id="SM">
 - a. Done
 31. remove all instances of @cert from <persName>
 - a. Done
 32. remove @ref and remove all instances of <person>
 - a. the @ref was added to point to the <person> elements that I created to store the long notes that had previously been stored in abused @rend attributes. I thought we had agreed to do that. If I remove them, what should happen to these long notes? My preference would be to keep them. **Let me know.**
 33. remove all instances of <roleName>
 - a. Done
 34. correct <settlement type="villiage"> to <settlement type="village">
 - a. Done
 35. change <supplied reason="by"> to <supplied>
 - a. This doesn't exist as such, it comes from <supplied reason="original obscured by frame">)/supplied> ... should I remove or change to 'obscured'? **Let me know.**
 36. change <term type="body_part"> to <term type="bodypart">
 - a. Done
 37. change <term type="city"> to <placeName><settlement type="city">
 - a. Done
 38. change <term type="trib"> to <term type="tribe">
 - a. Done
 39. remove <term type="bible_verse">
 - a. Done
 40. change <term type="Boat"> to <term type="boat">
 - a. Done
 41. change <term type="rreference"> to <term type="reference">
 - a. Done
 42. change <term type="ship"> to <term type="boat">
 - a. Done
 43. change <term type="vectorInsect"> to <term type="insect">
 - a. Done
 44. <term type="Tribe"> to <term type="tribe">
 - a. Done
 45. change <term xml:lang="und"> to <foreign xml:lang="und">
 - a. Done
 46. replace <term type="african_word"> with <foreign xml:lang="und">
 - a. Done
 47. remove of instances of @agent and @resp on <unclear>
 - a. Done
